

01 — Product Design

Vision, users, journeys, screens, requirements and design system

CampusFlow • Production Specification • v1.0 • October 2026

1. Product Vision

Vision: Everything important on campus. One organized place.

Core promise: the student should answer in seconds: What changed? What do I need to do? When is it due? What opportunities are available?

Principle: information must lead to action. Every notice explains what happened, who is affected, what action is required, and by when.

2. Personas

Student

Goals: finish required work, discover opportunities, understand today's priorities.

Pain: information scattered across WhatsApp, PDFs, notice boards, email and websites.

Needs: personalized dashboard, deadlines, official notices, events, notifications and search.

Faculty / Coordinator

Goals: communicate accurate information once to the correct audience.

Pain: reposting information across groups.

Needs: publishing, audience targeting, scheduling and auditability.

Administrator

Goals: control official communication and platform governance.

Pain: fragmented communication and weak visibility.

Needs: roles, review workflow, audit logs, user/content management.

3. Audience Targeting

CampusFlow must support Department → Year → Division → Batch targeting.

College → Department → Year → Division → Batch

Examples:

MCA / FY / A / F1

MCA / FY / A / all batches

MCA / FY / all divisions

MCA + MBA / FY / all divisions / all batches

College-wide

Audience is resolved server-side.

4. Core User Journeys

Journey A — Student discovers deadline

Login → dashboard → priority card → deadline detail → required action/source document.

Journey B — Student registers for event

Open event → verify eligibility/deadline/capacity → register → transaction checks duplicate and capacity → confirmation notification.

Event capacity is a backend/database transaction problem, not a frontend check.

Journey C — Admin publishes notice

Create/upload → validate → resolve audience → publish → notify eligible users → append audit log.

5. Screens S01–S16

S01 Login — college email/password, show/hide password, validation, secure session.

S02 Dashboard — greeting, priority summary, deadlines, high-priority notices, events, unread count.

S03 Notice List — search, category/priority filters, unread state, pagination.

S04 Notice Detail — official content, publisher, date, source document, attachments, AI summary disclosure.

S05 Deadline List — upcoming/overdue/all, urgency sorting and source.

S06 Event List — search, category/date filters and registration state.

S07 Event Detail — date, venue, organizer, capacity, eligibility, deadline and CTA.

S08 Calendar — month/list views with deadlines and events.

S09 Notifications — read/unread state, timestamp and action target.

S10 Profile — name, college email, department/year/division/batch and preferences.

S11 Admin Dashboard — content counts, registrations and recent activity.

S12 Notice Editor — draft/edit/publish and audience targeting.

S13 Event Editor — create/edit/publish.

S14 Registration Management — search, filter and export.

S15 User Management — search, status and authorized role management.

S16 Audit Logs — actor, action, entity, timestamp and metadata; admin only.

6. Success Metrics

Discovery time: <30 seconds.

Action visibility: >90% usability-test target.

Standard notice publishing: <3 minutes for a trained admin.

Normal application reliability: >99.5%.

7. Design Tokens

Primary #4F46E5.

Background #F8FAFC.

Text #0F172A.

Font Inter/system UI.

Radius 8–14px.

Spacing uses a 4px base scale.

8. Product Rules

- Original official document is authoritative.
- AI is assistive only.
- Source file/URL remains attached to published content.
- Audience is resolved server-side.
- Published records are archived/soft-deleted.
- Urgent actions precede discovery content.
